Abstract: This publication is one of a series of reports presenting socio-economic data for small areas within Maryland. This report tabulates and maps data pertaining to age composition and mobility. The data were derived from the 1970 Census of Population and Housing.

The report provides basic data for election districts and places with a population of 2,500 persons or more in 1970. Age structure of the population is detailed by race and sex; mobility refers to movement of the 1970 resident population between 1965 and 1970. Selected indicators were mapped by region at the election district level.

This report was developed to provide demographic and mobility information to assist local capital planning programs and to provide an input into an integrated set of socio-economic data for small areas in Maryland. It is hoped that this data will assist in the creation of a comprehensive State data base, and in problem identification and program planning at the local, county and regional level.

VLADIMIR A. WAHBE
SECRETARY OF STATE PLANNING
MADELINE L. SCHUSTER
DEPUTY SECRETARY

December 15, 1973

The Honorable Marvin Mandel
Governor of Maryland
State House
Annapolis, Maryland 21404

Dear Governor Mandel:

I am pleased to transmit herewith the report entitled "Maryland 1970 Social Indicator Series, Volume II: Age and Mobility Characteristics". This report is the second in a series designed to provide information of analytical significance on the socioeconomic status of the population in Maryland by small areas.

Based upon data retrieved from the 1970 Census of Population and Housing, it is anticipated that the report will assist not only in problem identification but also in program planning at the local, county and regional levels.

Copies of the report are being distributed to interested agencies and individuals throughout the State.

Sincerely,

Vladimir Wahbe

Enclosure

I. AGE AND MOBILITY CHARACTERISTICS

The purpose of this report is to provide basic demographic data and change of residence information for small areas and places in Maryland These data serve as strategic elements of studies and analyses relating to socioeconomic problems or opportunities at a local or regional scale. This report is also useful in conjunction with the other reports of this series which display additional socioeconomic information and indicate local variations in population composition by age, race and sex.

The presentation of basic population data by age and sex are useful for comparing population composition of areas with similar urban-rural characteristics as well as comparing population size by area. It is also useful for analysing the attributes displayed in percentage terms for the other reports of this series. This is particularly important for interpreting data for nonwhite persons in areas with a small nonwhite population base. The computation of percent distributions also assists relative comparisons of population between areas. This is useful for locating areas whose population composition varies significantly from the state or county norm.

The tabulations referring to population movements over the previous five year period indicate the magnitude of population flow into an area. While the lack of equivalent data for population outflow reduces the utility of the data for deriving net migration patterns, some measure of relative attractiveness of urban vis-a-vis rural areas can be determined and aid in the identification of areas showing tendencies towards urbanization.

II. DESCRIPTION OF AGE AND MOBILITY INDICATORS

Age Composition Data

The statistics detailing age composition were derived from questions asked on all questionnaires distributed by the Bureau of the Census. The data are arranged by sex, and arrayed in six age groups. These correspond to persons under six, 6 to 15, 16 to 24, 25 to 44, 45 to 64, and sixty-five and over. With the exception of the first two categories, the selected age groups correspond to major labor force participation categories. The detailing of population age composition for small areas and places will be useful for comparing age-sex population differences, and for computing population-based ratios for data contained in other reports of this series.

The median age calculations are comparable to median education and median income characteristics tabulated in other reports of the series. These statistics together form a capsule image of the State, which can be readily mapped and compared.

Mobility Data

The mobility statistics were derived from a fifteen percent sample of census questionnaires. The data provide considerable detail on source of migration into an area from areas within Maryland, from other states, and from abroad. The data breakdown used in this report concentrates on internal migration. Interstate and international immigration data are also provided. A cautionary note regarding the use of this data should be made at this time. Migration movement is recorded only for the 5 year period between 1965 and 1970. Also, the statistics refer only to migration into an area, not net migration. Structural changes in the population resulting from migration can only be estimated from comparisons of age composition over time.

III. REVIEW OF STATISTICS

The attributes displayed in this report were arrayed to facilitate their use in the analyses aspects of local planning and program development and all supplemented by a set of computer prepared maps. The maps provide ready visual comparison of any element in the data set, or any statistics created by data manipulation. The selected data is displayed at the MCD level in this report. The maps can assist in describing spatial interrelationships between characteristics, or comparing performance of a single attribute between areas, or both.[1]

A. Age Composition

1. The median age data for Maryland indicate a significant differential between males and females in 1970, reflecting the longer life expectancy for females. Median ages for whites are higher than nonwhites, highlighting the difference in age structure between the two segments of the population. The statistics indicate that the Western Maryland and Eastern Shore regions have older populations than the remaining regions for both the white and nonwhite population sectors. These observations may be useful for agencies who are concerned with concentrations of the aged and young segments of the population. In addition, mapping of the median age data highlights the area and racial differences and examined along with similar maps representing median income can be useful in the identification of areas characterized by pockets of aged persons with low income and young persons with low income.

2. The percent distribution of population by age details the above-noted differences between male and female population structure. There are

---

[1] The initial program to generate computer maps was provided by Dr. David Cowen and Dr. Paul Lovingood, Department of Geography, University of South Carolina.

more females than males in both absolute and relative terms in both age categories over forty-five. This holds true for both the urban and rural population, and also the rural population between twenty-five and forty-four years of age. The total nonwhite population distribution is somewhat different, as there are more females both absolutely and relatively in all age groups over sixteen. Further analysis of the population structure at the regional, county, MCD or place level is useful in noting structural differences in age composition by area and race.

These characteristics may affect changes in or can facilitate analysis of the adequacy of existing public housing programs and facilities. The locational distribution of persons over sixty-five is useful in measuring the coverage of existing programs, or in devising new localized programs to meet the special social, health, welfare and/or housing needs of this segment of the population.

3. In analyzing the age data by region, it is interesting to note that Baltimore Region, along with the Western Maryland and Eastern Shore regions, has a relatively large proportion of its population 45 years of age and over. One would anticipate that the performance of Baltimore Region would more closely approximate that of the other metropolitan region, Washington Suburban, which has a higher proportion of its population in the younger age groups. In analyzing the data at a county and MCD level, the data indicates that the age structures of the counties, with the exception of rural areas such as Carroll County and northern Baltimore County, is much younger than for the Region as a whole. The City of Baltimore, on the other hand, has a large proportion of its population in the two oldest age groups. The disparity in the population structure between the city and the surrounding urban areas may reflect the city's inability to fulfill the housing requirements of young families, and in general the problems of urban decay.

4. Age dependency ratios[2] are useful, but necessarily inexact, tools for approximating the size of the dependent population relative to the population in the productive age groups.

The dependent population is composed of two categories: the youth segment, here designated as persons fifteen years of age and younger, and the aged segment, defined as persons sixty-five years of age and over. The productive population is defined as the population sixteen to sixty-four years of age. These figures can be only approximations of the actual dependency ratios because not all persons 15 and younger and 65 and over are dependent on the remainder, and not all persons 16 to 64 will enter the labor force. However, when used in conjunction with the other reports, specifically, data regarding labor force participation, employment status, income level and source, and education attendance data, it can be a useful tool in studies of economic potential or poverty status.

5. The accompanying maps displaying dependency ratios by MCD indicate that the greatest variation occurs in the 50 to 100 range. Dependency ratios for the nonwhite population appear higher than for the white population, reemphasizing the high proportion of persons under sixteen years of age.

Users of these statistics should use caution in comparing ratios for the white and nonwhite population, particularly in MCD's where the nonwhite population base is small. For example, Western Maryland Region and parts of Frederick and Metropolitan Baltimore regions show extremely high dependency ratios in areas with a very small nonwhite population.

6. Analyses of urban-rural differences in the relative number of males and females by specific age groups may assist in determining local needs for public facilities. For example, a larger number of females than males in

---

[2] The dependency ratio is defined as the number of persons under sixteen and over sixty-four per 1000 persons between 16 and 64 years of age.

the 16 to 24 year age group may indicate the presence of a significant number of unmarried persons in an area. This in turn may indicate a discrepancy between housing needs and existing housing needs and existing housing stock.

B. Mobility

The following observations and suggested data uses refer only to migration into the appropriate areas.

1. The accompanying statistics indicate that a greater proportion of the population resided in the same residence in 1965 and 1970 than moved to a different residence. However, for nonwhite persons and urban residents, the opposite situation held true. Most of the movement took place within the State, and occurred mainly within the same county. Urban areas experienced a higher percentage of movement within the same county than did rural areas. This reflects, in part, the rural to urban population movement and the greater tendency towards rented accommodations in urban areas, with the resultant higher mobility within a localized area. This data could assist in studies concerning housing needs and standards as it relates to different patterns of movement between the white and nonwhite sectors of the population. The data appears to show considerably different mobility between the two sectors, with the nonwhite population showing the highest intra-county mobility in the regions (Metropolitan Baltimore and Southern Maryland) where white intra-county mobiility is lowest.

2. The use of mapping techniques for visual presentation of the data highlights regional and racial differences in mobility. This may be a useful analytical technique for reference purposes.

IV. GUIDE TO USING THE DATA

The county level data are ordered alphabetically by region. The statistics for minor civil divisions (MCD's), election districts in Maryland, are additive to the county totals. Data for urban places are presented separately, as MCD boundaries cannot always be equated with those of a defined urban center. In some cases the county total derived from adding the MCD data differs slightly from the total given on the State summary tables. In these instances full data disclosure is not presented at the MCD level in order to insure confidentiality of responses in areas where there were very few individual responses from specific population groups. This may occur in sparsely populated areas or areas with a very small nonwhite population. In such cases, a minus one (-1) in the data at the MCD level may indicate such suppression of data.

Unincorporated centers are indicated by the letter "U" in parentheses after the place name. In cases where an urban place straddles two counties, the term "part" is indicated in parentheses after the place name.

The accompanying maps can be used to assist in interpreting the MCD data for a county, regional, or even State perspective. The degree of differentiation or homogeneity between contiguous areas with respect to a single or several indicators can be observed readily using the mapping technique. For example, the existence of a Baltimore-Washington corridor of high performance in certain indicators can be readily observed using the mapping technique.

The consistent use of a graduated set of symbols for data ranges can indicate the relative performance of a specific area, compared to other areas, for several indicators. The symbols highlight the existence or absence of spatial patterns of performance both within and across adjacent regions.

The maps can assist in the identification of areas which exhibit unusual performance with respect to a particular indicator. This can be useful in detecting areas which are strongly influenced by overriding factors such as population density or accessibility to urban areas. Urban-rural patterns of performance can be readily identified, which assists in the analysis of the data as presented in tabular form.

The maps provided in this report are only a selection of what were considered the more significant attributes. In the Age and Mobility Characteristics Report, all mapped indicators can be derived from the tables presented in the report. The user is thus able to compare the actual value of a certain attribute for a specified area, and the relative performance of that area with respect to a defined range of values.

V. DEFINITIONS[3]

Geographic Areas

Minor Civil Divisions--These are the primary political and administrative sub-divisions of a county. Note: In Maryland, it corresponds to an election district.

Population Census Concepts

Urban-rural residence--This is one of the most important breakdowns of the population by geographic residence. Geographic areas are classified as urban or rural on the basis of their population size or density at the time of the census.

1. Urban population--Generally, all persons residing in areas determined to be urbanized areas or in places of 2,500 or more outside urbanized areas. A common breakdown of the urban population is given below.
   i) Population in central cities of urbanized areas.
   ii) Population in urban fringe of urbanized areas.
   Population in urbanized areas but not in central city.
   iii) Other urban population outside urbanized areas.
   Population in places of 2,500 or more outside urbanized areas.
2. Rural population--Population not classified as urban constitutes the rural population.

Race--This refers to the division of the population into white, Negro, and several other racial categories. These racial categories do not correspond to strict scientific definitions of biological

---

[3] Exerpted from the Census Users' Dictionary, U.S. Department of Commerce, 1970 CENSUS USERS' GUIDE, Part I, 1970.

stock. Persons were asked to indicate their race by selecting one of the following: White; Negro or Black; Indian (American); Japanese; Chinese; Filipino; Hawaiian; Korean; Other (specify). (In Alaska, Hawaiian and Korean were omitted and Aleut and Eskimo were added.)

Median age--This is calculated as the value which divides the age distribution into two equal parts, one-half the cases falling below this value, one-half above. Median age is generally computed from the age intervals or groupings shown in the particular tabulations, except that median age in tabulations of single years of age is based on five-year age groups.

Mobility status--This refers to the geographic mobility of the population age five years and older, comparing the place of residence at time of census with the place of residence five years ago.

1. Non-movers (in same house)--Persons living in the same house at time of census as five years ago. Includes those who had moved but returned.
2. Movers (mobile population)--Persons living in a different house in the United States at time of census than five years ago. Includes only persons for whom sufficient information concerning place of residence five years ago is obtained. (Missing information is supplied where available from other members of the person's family.) A common breakdown of the mobile population is given below.
   i) Intra-county movers--Persons living in a different house but in the same county at time of census as five years ago. Includes those who had moved from the county but returned.

ii) Inter-county movers (migrants)--Persons living in a different county at time of census than five years ago. The migrant population is commonly broken down into inter-county migrants, same State and inter-county migrants, different State.

3. Abroad--Persons residing in a foreign country or an outlying area of the U.S. five years ago.

4. Moved, place of prior residence not reported--Includes persons living in a different house at time of census than five years ago, but did not provide sufficient or consistent information about their previous place of residence.

   Also includes persons who gave no indication whether their place of residence at time of census was different from or the same as their place of residence five years ago, but who in response to the question on year moved into present house indicated that they moved into their present house within the five-year period before the census.
